**Fact 0.1** (Markov's inequality). For any positive random variable  $X$ :

$$\Pr(X > t) \leq \frac{E[X]}{t} \quad (1)$$

**Fact 0.2** (Chebyshev's inequality). For any random variable  $X$

$$\Pr[|X - E[X]| > t] \leq \frac{\sigma^2(X)}{t^2} \quad (2)$$

**Theorem 0.1** (Chernoff's bound). Let  $X_i$  be a set of **independent** random variables such that  $\mathbb{E}[X_i] = 0$  and  $|X_i| \leq 1$  almost surely. Also define  $\sigma_i^2 = \mathbb{E}[X_i^2]$  and  $\sigma^2 = \sum_i \sigma_i^2$ . Then:

$$\Pr\left[\sum_i X_i \geq t\right] \leq \max(e^{-t^2/4\sigma^2}, e^{-t/2})$$

*Proof.*

$$\Pr\left[\sum_i X_i \geq t\right] = \Pr\left[\lambda \sum_i X_i \geq \lambda t\right] \quad (\text{for } \lambda \geq 0) \quad (3)$$

$$= \Pr[e^{\lambda \sum_i X_i} \geq e^{\lambda t}] \quad (\text{because } e^x \text{ is monotone}) \quad (4)$$

$$\leq \mathbb{E}[e^{\lambda \sum_i X_i}] / e^{\lambda t} \quad (\text{by Markov}) \quad (5)$$

$$= \prod_i \mathbb{E}[e^{\lambda X_i}] / e^{\lambda t} \quad (6)$$

Now, for  $x \in [0, 1]$  we have that  $e^x \leq 1 + x + x^2$  so  $\mathbb{E}[e^{\lambda X_i}] \leq 1 + \mathbb{E}[\lambda X_i] + \lambda^2 \mathbb{E}[X_i^2] \leq 1 + \lambda^2 \sigma_i^2$ . Now, since  $1 + x \leq e^x$  we have that  $1 + \lambda^2 \sigma_i^2 \leq e^{\lambda^2 \sigma_i^2}$ . Combining the above we have that  $\mathbb{E}[e^{\lambda X_i}] \leq e^{\lambda^2 \sigma_i^2}$

$$\prod_i \mathbb{E}[e^{\lambda X_i}] / e^{\lambda t} \leq \prod_i \mathbb{E}[e^{\lambda^2 \sigma_i^2}] / e^{\lambda t} \quad (7)$$

$$= e^{\lambda^2 \sigma^2 - \lambda t} \quad (8)$$

Now, optimizing over  $\lambda \in [0, 1]$  we get that  $\lambda = \min(1, t/2\sigma^2)$  which completes the proof.

### 0.1 Other Useful forms

**Chernoff's inequality:** Let  $X_1, \dots, X_n$  be independent  $\{0, 1\}$  valued random variables. Each  $X_i$  takes the value 1 with probability  $p_i$  and 0 else. Let  $X = \sum_{i=1}^n X_i$  and let  $\mu = E[X] = \sum_{i=1}^n p_i$ . Then:

$$\Pr[X > (1 + \varepsilon)\mu] \leq e^{-\mu\varepsilon^2/4}$$

$$\Pr[X < (1 - \varepsilon)\mu] \leq e^{-\mu\varepsilon^2/2}$$

Or, using the union bound:

$$\Pr[|X - \mu| > \varepsilon\mu] \leq 2e^{-\mu\varepsilon^2/4}$$
